COMPLEX VECTORS AND MATRICES, INNER PRODUCTS FOURIER MATRIX, FOURIER TRANSFORM (DFFT)

RULES IN CMPLX SPACE

FOR COMPLEX MATRICES WE CALCULATE LENGTH AS

INNER PRODUCT (A,B complex)  $A \cdot B = \overline{B}^T A = B^H A$ 

SYMMETRIC MATRICES (complex)

SYMMETRIC IF AT = A = AX (HERMETIAN)

EXAMPLE :

A = 3-i 5 Note, dragena enhies must be real! LThis is a Hermitian Matrix

PERPENDICULAR

PERPENDICULAR IF FOR Vectors

WE HAVE

$$\bar{q}_{i} q_{i} = \begin{cases} 0 & i \neq j \\ 1 & i = j \end{cases}$$

EXAMPLE :

$$Q = \begin{bmatrix} 1 & 1 & 1 \\ 9 & 9 & 1 \\ 1 & 1 & 1 \end{bmatrix}$$

$$\bar{Q}^TQ = I = Q^HQ$$

UNITARY (CM) <=> ORTHOGONAL (RM)

## FOURIER MATRIX

\* Note, we use EE notation for the rest of this lecture So that column 1 is now column 0, so we have n rows/cols numbered from 0 to n-1

$$F_{n} = \begin{bmatrix} 1 & 1 & 1 \\ 1 & W & W^{2} & W^{n-1} \\ 1 & W^{2} & W^{4} & W^{2(n-1)} \end{bmatrix} \Rightarrow (F_{n})_{i,j} = W^{i,j} = 0 \text{ for } n = 1$$

$$W^{n+1} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ W^{2} & W^{4} & W^{2(n-1)} & W^{2(n-1)^{2}} \end{bmatrix} \Rightarrow (F_{n})_{i,j} = 0 \text{ for } n = 1$$

$$W^{n+1} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ W^{2} & W^{2} & W^{2} & W^{2} & W^{2} \end{bmatrix} \Rightarrow (F_{n})_{i,j} = 0 \text{ for } n = 1$$

$$W^{n+1} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ W^{2} & W^{2} & W^{2} & W^{2} \end{bmatrix} \Rightarrow (F_{n})_{i,j} = 0 \text{ for } n = 1$$

$$W^{n+1} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ W^{2} & W^{2} & W^{2} & W^{2} \end{bmatrix} \Rightarrow (F_{n})_{i,j} = 0 \text{ for } n = 1$$

$$W^{n+1} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ W^{2} & W^{2} & W^{2} & W^{2} \end{bmatrix} \Rightarrow (F_{n})_{i,j} = 0 \text{ for } n = 1$$

$$W^{n+1} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ W^{2} & W^{2} & W^{2} \end{bmatrix} \Rightarrow (F_{n})_{i,j} = 0 \text{ for } n = 1$$

$$W^{n+1} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ W^{2} & W^{2} & W^{2} \end{bmatrix} \Rightarrow (F_{n})_{i,j} = 0 \text{ for } n = 1$$

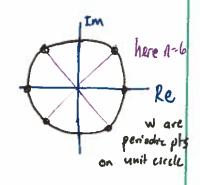

$$W^{n+1} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ W^{2} & W^{2} & W^{2} \end{bmatrix} \Rightarrow (F_{n})_{i,j} = 0 \text{ for } n = 1$$

$$W^{n+1} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ W^{2} & W^{2} & W^{2} \end{bmatrix} \Rightarrow (F_{n})_{i,j} = 0 \text{ for } n = 1$$

$$W^{n+1} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ W^{n+1} & W^{n+1} & W^{n+1} \end{bmatrix} \Rightarrow (F_{n})_{i,j} = 0 \text{ for } n = 1$$

WHAT IS THE NUMBER W?

WE WANT  $W^{n} = 1$ WHICH IS SATISFIED BY  $W_{n} = e^{i 2\pi / n}$ 

## 4×4 FOURIER MATRIX

$$F_{4} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & i & i^{2} & i^{3} \\ 1 & i^{2} & i^{4} & i^{6} \\ 1 & i^{3} & i^{6} & i^{9} \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & i & 1 & -i \\ 1 & -i & -1 & 1 \end{bmatrix}$$

TO SEE THIS TAKE INNER PRODUCT OF ANY (AND ALL)

2 COLS USING FACT A: A; = A; A; , I IF ZERO

THIS FACT MEANS ITS EASY TO INVERT F

$$\begin{bmatrix} F_{64} \end{bmatrix} = \begin{bmatrix} I & D \\ I & -D \end{bmatrix} \begin{bmatrix} F_{32} & 0 \\ 0 & F_{32} \end{bmatrix} P$$

# CALCULATIONS = 
$$(32)^2 + 32$$

$$D = \begin{bmatrix} 1 & w & & & \\ & w^2 & & & \\ & & & & \end{bmatrix}$$

IF WE DECOMPOSE 32 MATRIX TO 16

# CALCULATIONS

$$= 2\left(2(16)^2 + 16\right) + 32 \xrightarrow{\frac{1}{2}n \log_2 n}$$

CONSIDER CASE 
$$N = 1024$$

$$N^2 = 2^{20} \rightarrow 1 \text{ million}$$

$$\frac{\Lambda}{2} \log_2 n = 5.1024 \sim 5,000 \quad \text{MUCH BETTER!}$$
